

HOW TO ASSEMBLE YOUR 40" OR 50" VACBED

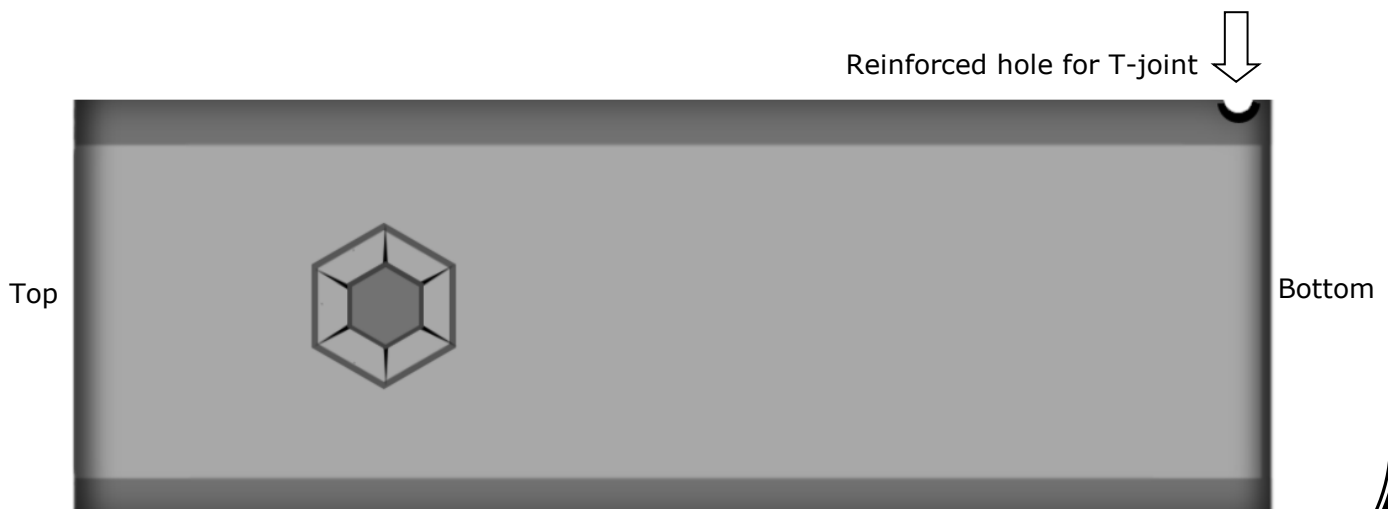

Our Vacbeds work a little differently. Instead of using a zipper that can leak and break, our vacbeds are more like a sleeping bag that opens at the top. You wiggle in and use our closure bar for an air tight seal, just like a big zip-lock bag. Once suctioned down you will be able to turn off your vacuum and only need to flip on the vacuum for 20-30 seconds every 10 or 15 mins to keep it super tight as long as it is setup and sealed properly. (see tips page)

Here are a helpful set of assembly instructions to get you started. If you are stuck or you are finding something difficult it is always best to shoot us a message at info@kinkengineering.com. Don't force anything. And as always, remember to **NEVER TO DO THIS ALONE**.

Shown in diagrams, 50" vacbed (slight wraparound of bottom colour)

Step 1:

- Setting up your vacbed on a protected surface is a good idea. Most importantly you need to rid the area of anything sharp or metal to prevent puncturing or discoloring the latex.
- Spread out you vac bag on the floor. Make sure you have ample space to walk around without crowding your bed.
- Now is the time to familiarize yourself with your vacbed. Give it a good look over and if there are any issues, stop, take a picture and e-mail us immediately.

Step 2:

- Take all your frame pieces and marvel at how awkward they look.
- Attach the side pieces together and insert them into the top and bottom frame bits.
- Make sure that you are pushing them into the joints all the way. We don't want it to come apart on you.
- You can use tape to secure the corner bits and the side bits together for a more secure connection if you like. This is not mandatory but can be helpful. We suggest clear sports tape as we have found that it leaves the least amount of residue behind.

- Here is where it gets tricky.
- Take the vac bag and starting from the bottom of the frame (Making sure the T-joint will line up with the reinforced hole for the T-joint) begin stretching the bag over the frame. **WATCH YOUR NAILS!** You don't want to puncture your bed before you even get to use it! Powdering the inside of the vac bag can help if you are having trouble.
- Make sure that the T-joint sticks out of the hole at the bottom and smooth out any wrinkles

Step 3:

- Now to use the vacbed!
- First, put all the toys, ice cubes, crops, suction cups ... or whatever! within an arms length. No leaving the room to grab something you forgot once you start.
- Attach the one-way valve to the bottom T-joint and make sure that the valve allows air to be sucked out of the bed and not the other way around. (sucks not blows) You will want to use your clear sports tape again and tape up the junction where the 1-way valve and the T-joint meet to prevent leaks.
- Plug a vacuum hose into the one-way valve in the OFF position, any vacuum will do (we like using a small canister vacuum as it is compact and we can leave the hose attached) and tape that down too.
- Have the user remove all sharp objects, be mindful of their nails (if applicable) and crawl into the bed. Have them take a comfortable position and make sure there are no air leaks. (see tips)
- Sandwich the opening of the vacbed between the metal and the rubber cord and press down. The rubber cord will need to be completely in the metal channel to work correctly. To make this easier you can apply a bit of lube to the channel and the cord. Doing this on a hard surface will be the easiest.

Its time try it out! Make sure you have a trusted friend to help you out and you are good to go! They are also there to make sure you are safe, happy and well played with. If you ever have any questions just e-mail us at info@kinkengineering.com. Enjoy!

REMEMBER! NEVER USE YOUR VACBED ALONE!
NEVER!
